

CivicPulse AI

From Citizen Voice to Government Action

AI-powered public infrastructure intelligence

Government receives complaints. Communities experience patterns.

1

Requests arrive through fragmented channels and multiple languages.

2

Many requests describe the same underlying infrastructure problem.

3

Individual requests rarely show population impact or infrastructure context.

4

Workflows become reactive: ticket by ticket rather than need by need.

5

Decision-makers need evidence to tell an isolated complaint from a persistent community gap.

*The problem isn't that governments lack complaints — **it's that the signal hidden inside those complaints is difficult to see.***

A complaint is often a signal of a larger need.

TRADITIONAL VIEW

- Complaints logged one at a time
- Free-text tickets, no structure
- Volume treated as noise
- Category assigned, context lost
- Prioritized manually, inconsistently

AI TRANSFORMS

CIVICPULSE VIEW

- Requests clustered into community signals
- Structured, multilingual evidence
- Volume read as contextual demand
- Mapped to concrete infrastructure gaps
- Prioritized transparently by a deterministic model

CivicPulse AI creates a public infrastructure intelligence layer.

1 Listen

Accept multilingual text, voice and photo evidence.

2 Understand

Gemini extracts issue type, service, severity, urgency and structured context.

3 Consolidate

Semantic + taxonomy + geography guardrails group related requests into community signals.

4 Contextualize

Combine demand with population, infrastructure, facilities and investment context.

5 Prioritize

Calculate a transparent, deterministic priority score.

6 Recommend

Grounded Gemini reasoning explains gaps and proposes evidence-backed interventions.

7 Assist

Policymakers query governed data through a controlled Policy Copilot.

How It Works: Request → Signal → Gap → Priority → Recommendation

VERIFIED HERO SCENARIO — LIVE ON DEPLOYED URL

**“Five days without
drinking water”**

Bellandur, Ward 150

20

related citizen requests

92.1

priority score — CRITICAL, City Rank #1

Weak service reliability + affected population → high-priority gap → targeted supply-network intervention.

AI + Google Cloud Architecture

Requests flow top to bottom through managed Google Cloud services.

Deliberately managed services — engineering effort goes into the intelligence layer, not infrastructure management.

AI assists decisions. It does not silently make them.

1

Closed taxonomy with UNKNOWN / NEEDS_CLARIFICATION instead of forced classification.

2

Multimodal evidence is treated as evidence, not absolute truth.

3

Semantic clustering uses geography, taxonomy and context guardrails.

4

Priority score is deterministic and versioned — confirmed live as v1.0.0-deterministic.

5

Gemini explains the score; it cannot override or recalculate it.

6

Recommendations cite evidence and expose caveats.

7

Policy Copilot uses controlled read-only tools, not unrestricted system access.

8

No unnecessary sensitive inference; citizen input is treated as untrusted data.

Let's Follow One Community Need

LIVE DEMO — deployed on Google Cloud Run

- 1** **Citizen intake** A resident reports five days without drinking water.
- 2** **AI result** Gemini understands the issue, service, urgency and location context.
- 3** **Community cluster** The system finds 20 related requests across multiple languages.
- 4** **Gap detail** We combine demand with infrastructure, population and investment context.
- 5** **Priority** The score is calculated deterministically from transparent factors.
- 6** **Recommendation** Gemini turns the evidence into a grounded intervention with caveats.
- 7** **Policy Copilot** A policymaker asks why the area is high priority and retrieves governed evidence.

The Same Intelligence Layer Can Support Many Public Infrastructure Needs

LIVE TODAY

- Drinking water
- Multilingual citizen voice
- Community-level issue clustering
- Infrastructure gap assessment
- Transparent prioritization
- Evidence-backed recommendations

EXPANDS TO

ROADMAP

- Road connectivity
- Drainage / flooding
- Health access
- Education and sanitation
- Broader regional comparison
- Integration with public-service workflows

CivicPulse AI is not a better complaint box.

It turns scattered citizen voice into community signals, measurable infrastructure gaps, transparent priorities, and evidence-backed government action.

From citizen voice to government action.
